and acts as an antirepressor.
InDUCTION: Regulated during cell cycle progression are detected in lung, spleen and brain.
InDUCTION: Regulated during cell cycle progression functions that are divided into three independent repression domains (RD). RD2 and RD3). The C-terminal region contains the nuclear receptorand nature of the contains the nuclear receptorand comains (ID) and ID2.
Interacting domains that are divided in two separate interaction domains (ID) and ID2.
Interacting domains that of contains a conserved sequence referred to a the CORNR box. This motif is required and sufficient to permit binding to unliganded TR and RARS. Sequences of flanking the CORNR box determine nuclear hormone receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pfam; PF00249; myb DNA-binding; ...

Coiled c
nuclear receptors by promoting chromatin condensation, thus preventing access of the basal transcription.

SUBUNIT: Interacts with HDAC7 (By similarity). Forms a large corpersesor complex that contains SUBJA/B and histone deacetylases HDAC1 and HDAC2. This complex associates with the thyroid (TR) and the retinoid acid receptors (RAR) in the absence of ligand, and may stabilize their interacts with TFIIB. The SRMT isoform interacts with HDAC10. Interacts with MINT.

SUBCELLUIAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             specificity.

Isolation of a novel histone deacetylase reveals that class I and class II deacetylases promote SMRT-mediated repression.";
Genes Dev. 14:55-66(2000).
--- FUNCTION: Mediates the transcriptional repression activity of some nuclear receptors by promoting chromatin condensation, thus preventing access of the basal transcription.
---- SUBUNIT: Forms a large corepressor complex that complex associates and histone deacetylases HADAC1 and HDAC2. This complex associates with the thyroid (TR) and the retinoid acid receptors (RAR) in the absence of ligand, and may stabilize their interaction with TFIIB.

Interacts with HDAC10 and MINT (By similarity). Interacts with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             embryos.

DOMAIN: The N-terminal region contains repression functions that are divided into three independent repression domains (RDI, RD2 and RD3). The C-terminal region contains the nuclear receptor—interacting domains that are divided in two separate interaction domains (IDI and IDS).

DOMAIN: The two interaction domains (ID) contain a conserved bequence referred to as the CORNR box. This motif is required and sufficient to permit binding to unliganded TR and RARS. Sequences flanking the CORNR box determine nuclear hormone receptor
corepressor SMRT.";

```
DOMAIN: The V-terminal region contains repression functions that are divided into three independant repression domains (RDI, RD2 and RD3). The C-terminal region contains the nuclear receptorinteracting domains that are divided in two separate interaction domains (IDI and ID2).

DOMAIN: The two interaction domains (ID) contain a conserved bowain: The two interaction domains (ID) contain a conserved sufficient to permit binding to unliganded TR and RARS. Sequences flanking the CORNR box determine nuclear hormone receptor
                                                                                                                                                                                                                                                                                                                                                                                                                            TISSUE-Liver;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Corepressor complex the transcriptional repression activity of some nuclear receptors by promoting chromatin condensation, thus nuclear receptors by promoting chromatin condensation, thus nuclear receptors by promoting chromatin condensation, thus nuclear receptors of the basal transcription.

Therefore the complex that contains SIMSAP and histone deacetylases corepressor complex that contains SIMSAP and histone deacetylases corepressor complex that contains SIMSAP and histone deacetylases the retinoid acid receptors (RAR) in the absence of ligand.

SINGELUTIAN LOCATION: Nuclear (RAR) in the absence of ligand.

SINGELUTIAN LOCATION: Nuclear (RAR) in the absence of ligand.

Interacting domains region contains repression domains (RDI, RDZ and RD3). The C-terminal region contains the nuclear receptor and RD3. The C-terminal region contains the nuclear receptor domains (IDI and IDI2).

Interacting domains that are divided in two separate interaction domains (IDI and IDI2).

Sequence referred to as the CORNR box. This motif is required and sufficient to permit binding to unliganded TR and RARS. Sequences Elaming the CORNR box determine nuclear hormone receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         [3]

XI I Succeptor mRNA isoforms in rat skeletal muscle.";

XI Diochem. 264:982-988(1999).

XI I SUBCINION: Mediates the transcriptional repression activity of some nuclear receptors by promoting chromatin condensation, thus nuclear receptors by promoting chromatin condensation, thus nuclear sasociates with HDACT. Forms a large corepressor complex complex associates with the thyroid (TR) and the retinoid acid receptors (RAR) in the absence of ligand (By similarity).

C. -I SUBCELULAR LOCATION: Nuclear (By similarity).

C. -I DOMAIN: The N-terminal region contains repression functions that are divided into three independant repression domains (RDI, RDZ and RD3). The C-terminal region contains the nuclear receptor-and man RD3). The C-terminal region contains the nuclear receptor-and comains (IDI and ID2).

C. -I DOMAIN: The two interaction domains (ID) contain a conserved sequences of sequences of flanking the CORNR box. This motif is required and sequence referred to as the CORNR box. This motif is required so sufficient to permit binding to unliganded TR and RARS. Sequences of sequences of sequences of sequences of sequences of sequences of sequences.

Taniguchi Y., Rurcoka B. cell development by MINT, a suppressor of Notch Pathway. Baganian pathway.";

Immunity 18:301-312 (2003).

-I- FUNCTION: Essential corepressor protein, which probably regulates different key pathways such as the Notch pathway. Magative requiator of the Notch pathway via its interaction with RBPSUH, and therefore suppresses the transactivation activity of Notch signaling. Blocks the differentiation of precursor B cells into marginal zone B cells. Probably represses transcription via the recruitment of large complexes containing histone deacetylase proteins. May bind both to DNA and RNA.

- I- SUBUNIT: Interacts with NCOR2, HDAC1, HDAC2, RBBP4, MBD3 and MTALLI Interacts with he nuclear receptors RAR and PPRAD.

- Interacts with RAR in absence of ligand. Bind to the steroid receptor RNA coactivator SRA (By similarity). Interacts with MSX2.

- Interacts with RBPGUH; this interaction may prevent the

Expressed at lower level in brain, lung, spleen, liver and kidney. Weakly expressed in cardiac and skeletal muscles and ovary. In spleen, it is marghnessed in follicular B-cells, while it is weakly expressed in DOMAIN: The RID domain mediates the interaction with nuclear
                                                                                                                                                                                                                                      SIMILARITY: Contains which mediates the interaction with NCOR2, is essential for the repressive activity (By similarity). SIMILARITY: Belongs to the Spen family.
SIMILARITY: Contains 1 RID (receptor interacting) domain.
SIMILARITY: Contains 4 RNA recognition motif (RRM) domains.
SIMILARITY: Contains 1 SPC domain.
CAUTION: Ref. 4 sequence differs from that shown due to multiple frameshifts and conflicts that create stop codons.
CAUTION: Ref. 5 sequence differs from that shown due to what seems the both received interaction of the shown due to what seems the both received interaction of the shown due to what seems the both received interaction of the shown due to what seems the both received interaction of the shown due to what seems the both received interaction of the shown due to what seems the both received interaction of the shown due to what seems the both received interaction of the shown due to what seems the both received interaction of the shown due to what seems the both received in the shown due to what seems the both received in the shown due to what seems the shown 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to be the presence of intronic sequence in the CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WITH MSX2.

MICHALOR EV., Vanolate L., Biryukova I., Ramain P.;
Mentaler-promoter communication mediated by Chip during
Pannier-driven proneural patterning is regulated by Osa.";
Genes Dev. 17:591-596(2003).

-I-FUNCTION: Trithorax group (trxG) protein required for embryonic
segmentation, development of the notum and wing margin, and
photoreceptor differentiation. Required for the activation of
genes such as Antp, Ubx and Eve. Binds to DNA without specific
genes such as Antp, Ubx and Eve. Binds to DNA without specific
genes activate to promoters by
promoter-specific proteins. Essential component of the Brahma
complex, a multiprotein complex which is the equivalent of the
yeast SWI/SNF complex and acts by remodelling the chromatin by
catalyzing an ATP-dependent alteration in the structure of
nucleosomal DNA. This complex can both serve as a transcriptional
coactivator or corepressor, depending on the context. Acts as an
essential coactivator for Zeste, which recruits the whole complex
to specific genes. In contrast, it acts as a corepressor for Wg
target genes, possibly via an interaction with Pan and Gro. It
also acts as a negative required by Pan and Chi. Also represses E2f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- SUBGNIT: Component of the Brahma complex, which is composed of Brm, Osa, Mor. Sari/Bap45, Bap111/Dalao, Bap55, Bap60 and Bap47. Interacts with Par and Chi via its EHD domain.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- TISSUE SPECIFICITY: Ubjquitcusly expressed in early embryo. In thist instar larvae, it is ubjquitcusly expressed in a band just antenna imaginal disks, with a stronger expression in a band just antenna imaginal disks, with a stronger expression in a band just anterior to the morphogenetic furrow.
-!- DEVELOPMENTAL STAGE: Expressed both maternally and zygotically.
-!- DOMAIN: The ARID domains mediates the binding to DNA.
-!- SIMILARITY: Contains 1 EHD (Eyelid homology) domain.
-!- SIMILARITY: Contains 1 EHD (Eyelid homology) domain.
-!- CAUTION: Ref.2 (AAF5545) sequence differs from that shown due to erroneous gene model prediction.

-!- TISSUE SPECIFICITY: Expressed in most adult tissues, including a variety of hematcipoidetic cells, with the exception of the liver.-!- MISCELLANEOUS: This gene mapped to a chromosomal region involved in duplications and translocations associated with cancer.-: SIMILARITY: Contains 5 PHD-type zinc fingers.-: SIMILARITY: Contains 1 post-SET domain.-: SIMILARITY: Contains 1 RING-type zinc finger.-: SIMILARITY: Contains 1 RING-type zinc finger.-: SIMILARITY: Contains 1 RING-type zinc finger.-: SIMILARITY: Contains 1 SET domain.
                                                                                                                                "Activating signal cointegrator 2 belongs to a novel steady-state "Activating signal cointegrator 2 belongs to a novel steady-state complex that contains a subset of trithorax group proteins.";
Mol. Cell. Biol. 23:140-149[2003).
-!-FUNCTION: May be involved in transcriptional regulation.
-!- SUBMIT: Belongs to the ASC-2/NCOA6 complex (ASCOM), which contains ASC-2/NCOA6, the retinoblastoma-binding protein RBQ-3/RBBPS, alpha- and beta-tubulins, the trithorax group proteins MLL2 and MLL3, and ASH2/ASCL2 (Probable).

Involved in neuronal cell fate, survival and axon guidance, cell cycle regulation and repression of head identity in the embryonic trunk. May act with the Hox gene Deformed and the EGF receptor signaling pathway. Positive regulator of the Mg pathway in larval tissues but not in embryonic tissues. May act as a transcriptional corepressor protein, which repress transcription via the recruitment of large complexes containing histone deacetylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Name=4; Synonyms=SpenS; Isolate and Part and Par

L. FUNCTION: Nuclear receptor coactivates expression in an agonist-correct dependent fashion. Coactivates expression in an agonist-correct dependent manner. Involved in the coactivation of different nuclear receptors, such as for steroids (GR and ERS), and prostanoids (RARS and RXRS), thyroid hormone (TRS), vitamin D3 (VDR) and prostanoids (PARS), probably functions as a general coactivator, rather than just a nuclear receptor coactivator. May coactivator, rather than just a nuclear receptor coactivator. May coactivate expression via a remodeling of chromatin and its interaction with histone acetyltransferase proteins. Involved in the coactivator and embryonic development.

C. SUBUNIT: Monomer and homodimer. Interacts in vitro with the basal transactivation function. Interacts with NCOA1, CRSPBP, and WIRH, the methyltransferase proteins EP30 and CRSPBP, and wind which contains ASC-2/NCOA6 complex (ASCOM), complex of proper and homedime expension and with methyltransferase proteins EP30 and CRSPBP, and wind in nuclear such RNPILLI (By similarity).

C. Interacts with RNPC2. Belongs to the ASC-2/NCOA6 complex (ASCOM), complex of the interior are and health and heal

retina from Ell. In the alimentary tract and olfactory epithelium expression was seen from El3. Strong expression present in liver and kidney, from El1 and El3 respectively, and then expression decreased al later stages of development. Moderate expression in lung from El3, while it decreases during postnatal life. Strong expression in thymus from El5 onwards, and in spleen from El7 and during early postnatal life, then, the expression decreases. DOMAIN: Contains two leu-Xaa-Xaa-Leu-Leu (LXXLL) motifs. Only motif is essential for the association with nuclear receptors. PTM: Phosphorylated (By similarity).

-1- TISSUE SPECIFICITY: Highly expressed in brain. Low levels found in stomach. Not detected in other tissues analyzed including adrenal gland, testis and pancreas.
-1- DOWAIN: C2 domain 1 is involved in binding calcium and phospholipids. Calcium binds with low affinity but with high specificity and induces a large conformational change.
-1- SIMILARITY: Contains 1 PDZ/DHR domain.
                                                                      "Aczonin, a 550-kd putative scaffolding protein of presynaptic active zones, shares homology regions with rim and bassoon and binds profilin.";
                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE=22384373; Pubbed=12401783; Full Matsumoto M., Fujimoto K., Shibasaki T., Yokoi N., Kashima Y., Matsumoto M., Fujimoto K., Tajima N., Iwanga T., Seino S., Sasaki T., Tajima N., Iwanga T., Seino S., Seino S., Sasaki T., Tajima N., Iwanga T., Seino S., Cipa C., Ca2+ sensor in pancreatic beta-cells. TISSUE SPECIFICITY: Expressed only in brain (neuropil of cortex, CA1 region hippocampus and molecular layer of cerebellum be bevelopWENTAL STAGE: Expression increases from low levels at birth to high levels at 3-4 weeks before dropping slightly in adulthood. Expressed in the cortex and the molecular layer of the cerebellum at postnatal day 7. Isoform 2 expression does not change during developmment of both cortex and cerebellum. Isoform 4 expression decreases significantly during development of cortex but not
                                                                                                                                                                                                                                                                                                                                                                             Sheng M., Kim E.;

-1- FUNCTION: Seems to be an adapter protein in the postsynaptic density (PSD) of excitatory synapses that interconnects receptors of the postsynaptic membrane including NMON-type and metabotropic glutamate receptors, and the actin-based cytoskeleton. May play a role in the structural and functional organization of the dendritic spine and synaptic junction. Overexpression promotes maturation of dendritic spines and the enlargement of spine heads via its ability to recruit Homer to postsynaptic sites, and enhances presynaptic function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: May homomultimerize via its SAM domain. Interacts with SPTANI, Homer-I and DLGAPI/GKAP. Is part of a complex with DLG4/PSD-95 and DLGAPI/GKAP. Interacts with SSTR2 C-terminus via
              INTERACTION WITH HOWER-1, AND SUBCELLULAR LOCATION.

Isold=Q9UMN6-2; Sequence=VSP 006668, VSP 006669;
TISSUE SPECIFICITY: Widely expressed. Highest levels in testis.

    -1- FUNCTION: Possibly acts as a transcriptional regulatory factor.
    -1- SUBCELLULAR LOCATION: Nuclear (By similarity).
    -1- ALTERNATIVE PRODUCTS:

"I FUNCTION: Nuclear receptor coactivator that directly binds nuclear receptors and stimulates the transcriptional activities in a hormone-dependent manner. Involved in the coactivation of and AR2-dependent manner. Involved in the coactivation of and prostanoids (PARs and RKs), thyroid hormone (TRS), vitamin D3 (VDR) and prostanoids (PARs). Thyroid hormone (TRS), vitamin D3 (VDR) and prostanoids (PPARS). Thyroid hormone cactivator. May coactivate or rather than just a nuclear receptor coactivator. May coactivate expression vit a remodeling of chromatin and its committee. TISSUE=Cervical carcinoma;

Interacts with RNPC2 (By similarity). Interacts in vitro with the basal transcription factors GTF2A and TBP, suggesting an autonomous transactivation function. Interacts with NCOA1, CRSP3, RBM4, the histone acetyltransferases EP300 and CREBBP, and with the methyltransferases NCOA6IP and HRWTILI/PRMT2. Belongs to the ASC-Z/NCOA6 complex (ASCOM), which contains ASC-Z/NCOA6, the retinoblastoma-binding protein RBO-3/ RBBPS, alpha- and beta-tubulins, the trithorax group proteins MLL2 and MLL3, and MEDLINE=21417756; PubMed=11517327; Zhu Y.-J., Qi C., Cao W.-Q., Yeldandi A.V., Rao M.S., Reddy J.K.; "Cloning and characterization of PIMT, a protein with a methyltransferase domain, which interacts with and enhances nuclear receptor coactivator PRIP function."; "Activating signal cointegrator 2 belongs to a novel steady-state complex that contains a subset of trithorax group proteins."; MOI. SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate with MAPIA and MAPIB proteins.
DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.
FITH: LC1 is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by proteolytic processing. It is free to associate with both MAPIA and MAPIB. It interacts with the amino-terminal region
 might be involved in nucleating microtubule polymerization and in
